

Market Survey Report on Switzerland for Medical/Surgical Instruments, Optometry Instruments, X-Ray Equipment and Refined Copper & Copper Alloys, Unwrought

(Continued from previous issue)

market place 35

The Swiss Success Story

Medical technology is one of the most important growth sectors in Switzerland. Current conditions are good, but hunting down profits is hard for some.

Product diversity
The Swiss medical technology sector is extremely heterogeneous. The product range of companies quoted on the Swiss stock exchange includes devices such as screws, nails and plates for treating bone fractures (Synthes, www.synthes.com), dental implants (Nobel Biocare, www.nobelbiocare.com and Straumann, www.straumann.com), hearing aids (Phonak, www.phonak.com), injection systems (Ypsomed, www.ypsomed.com) and appliances for monitoring heart and lung functions (Card Guard, www.cardguard.com and SHL Telemedicine, www.shal.co.il). Although newspaper reports and studies frequently refer to the vast potential for innovation in medical technology in Switzerland, there is little data on the sector as a whole. In official statistics, the companies are simply subsumed under the general heading "manufacturers of medical and optical appliances, precision instruments and watches." Concrete figures on employment levels, turnover growth and market size are largely unavailable. As a result, publication of the first report on this sector¹ is a welcome development. In a short foreword to the report, Federal Councillor Joseph Deiss cites the criteria on which the success of the Swiss medical technology sector is based. These include highly qualified personnel, university research, strong networks linking research and industry, interesting tax conditions and access to numerous private-equity companies.

Industry profile
Eucomed, the European medical technology industry association, estimates that there are more than 500 medical technology

companies based in Switzerland, which employ 40 000 people and export goods to the value of approximately US\$5 billion (approximately €4.2 billion).
Based on a survey of 250 Swiss companies, the report arrives at some interesting conclusions. Of these, 40% are active in the dental implants and dental appliances field. Orthopaedics also features prominently with a 15% share. A further 10% of companies are active in the cardiovascular field (heart and vascular devices) and electromedicine (X-ray equipment, microscopes and lasers).

In search of employees
The origins of the companies questioned are instructive: 20% are university spin-offs and 10% are industrial hive-offs. Approximately 60% of respondents' companies were established as independent entities. The expansion in employee numbers suggests high growth rates. The study found that the companies have increased their staffing levels by an average of more than 10% per annum since 2001. Thus, it is not surprising that the recruitment of qualified employees, coupled with a lack of financial resources, represents the greatest challenge.

In search of profit
The majority of medical technology companies are small- or medium-sized enterprises. Approximately two-thirds of them have an annual turnover of less than 10 million Swiss francs or €6.6 million. Yet, only 65% of them are trading at a profit. Young companies in particular struggle with high fixed costs and their accounts are in the red. Established companies in a growth phase spend an average of 3-8% of their turnover on research and development. Thus, expenditure is higher than in

the chemicals sector (approximately 4%), but somewhat lower than in the pharmaceuticals sector (15-20%) or the biotech sector (20%).

Fears and challenges
Although most companies are confident about the future and feel that there are no signs of a trend towards saturation in the market, the regulatory situation gives them cause for concern. There are fears that increasing regulation will have a negative impact on Switzerland's attractive conditions and lengthen the development process for new products. The pressure to achieve savings in the health-care field will also have an effect. The trend towards shorter hospital stays means that the supervision of ambulant patients and technologies to accelerate the recovery process will become increasingly important.

medical device technology | January/February 2006

Brief Introduction of the Local Industry

Although raw materials are very limited in Switzerland, the country has a world-class manufacturing economy fabricating raw material imports into high-value added exports. The engineering industry, together with metals and electronics, employs about 9 per cent of the country's workforce and contributes around 40 per cent to Swiss export revenues. Leading areas in the sector include precision engineering, in particular the world-renowned Swiss clocks and watches (accounting for 8 per cent of export revenues in the early 1990s); scientific instruments; heavy engineering and machine building, including specialized, custom-built equipment such as generators and turbines; food products, particularly specialized luxury goods such as chocolate and cheese; textiles; chemicals; quality pharmaceuticals; and fine handicrafts.

Moderate GDP growth, both domestically and in Europe, has been keeping manufacturing growth down over much of the early and mid-1990s, but restructuring efforts carried out over the late 1990s have left the sector in a better and more competitive position. The strong tradition for creativity and innovation demonstrated by the Swiss industry in the past continues to thrive, particularly in new materials technology, micromechanics, and microelectronics, and other research and development-based products. Environmental technologies are expected to have a very good growth potential. The entering into force of multilateral trade liberalization accords signed in the 1990s (under the former General Agreement on Tariffs and Trade, which was succeeded by the World Trade Organization, and also with the EU) will be very important for the Swiss machinery sector. Export-oriented engineering manufacturers will benefit from lower tariffs and the liberalization of public **procurement** procedures within the EU. They will also improve conditions for Swiss direct investments abroad, and bring better protection for Swiss patents and technical know-how in the international markets.

The chemical industry (including the valued Swiss pharmaceuticals) was one of the sectors in the Swiss economy that performed very well in spite of the 1991-1997 **recession**. As with the engineering sector, chemicals will also benefit from liberalization; the positive effects may be of even greater magnitude. Within the chemical branch, pharmaceuticals offer the biggest growth potential and they will benefit most from better patent protection abroad. Agreements with the EU on the elimination of technical obstacles to trade by mutual recognition of trademarks, technical regulations, other rules and procedures for the testing and certification of industrial goods, will also boost Swiss trade with the union.

Local Manufacturers/Importers of the products under reference
